Week 2 | January 15, 2015

A gap exists in the way we frame our social norms, and the ability of collaborative technologies to incorporate it

What are some examples of human ability/states that technologies are still finding hard to incorporate?

P3P talks about privacy standards.  
Given the recent conversations around privacy and online technologies, what are different ways to preserve and negotiate privacy while bridging the gap between the social and the technical?

The paper also talks about context awareness of collaborative technologies. Has this happened? What are the biggest challenges to this capability?

Two other important considerations touched upon briefly in the paper – differences in the type of collaboration, and differential knowledge / adaptive ability toward technology use
