Homework 4

2001 A Space Odyssey

HAL 9000

Notable Achievements in AI since 1995

- Computer-controlled minivan “drove” on freeways across USA in 1995
- IBM supercomputer Deep Blue defeated chess champion Gary Kasparov in 1997
- Honda’s ASIMO android can climb and descend stairs and respond to human gestures and postures
- Electrolux introduced robotic vacuum cleaner in 2001
- Five autonomous vehicles successfully completed 128-mile course in Nevada desert in 2005
- Watson trounced two most successful human *Jeopardy!* champions in 2011

Stanley, the Autonomous Vehicle

Watson Wins *Jeopardy!* Challenge

HEALTH AND SCIENCE

Google's DeepMind A.I. beats doctors in breast cancer screening trial

PUBLISHED THU, JAN 2 2020 • 8:13 AM EST

David Reid
@DAVYREID73

SHARE    

KEY POINTS

- Anonymous scans of 29,000 women were used in the trial.
- The biggest improvements over human scanning was found in the U.S. portion of the study.
- Google-owned DeepMind has already used AI to read eye scans and spot neck cancer.

AI

How people are using AI to detect and fight the coronavirus

Chinese Hospitals Deploy AI to Help Diagnose Covid-19

Software that reads CT lung scans had been used primarily to detect cancer. Now it's retooled to look for signs of pneumonia caused by coronavirus.

Class Discussion 1

- How do we evaluate which AI based automations are worthwhile?
 - IBM Watson winning the Jeopardy Challenge
 - Google AI beating radiologists in cancer diagnosis
 - AI use in China to detect symptoms relating to COVID-19
- Discuss what societal benefits such technology can have. Does it pose any risks?

How Technology Is Destroying Jobs

Automation is reducing the need for people in many jobs. Are we facing a future of stagnant income and worsening inequality?

by David Rotman June 12, 2013

AUTOMATION HAS BEEN CHANGING THE JOB LANDSCAPE FOR MANY YEARS

- Over many decades:
 - Routine jobs (manual or cognitive) have declined.
 - Only non-routine jobs have continued to grow. (Source: Economist)
- Now: The most famous study on Job Loss and AI, by Carl Frey and Michael Osborne, predicts that 47% of the workforce is in danger.

WHAT JOBS ARE IN DANGER

- **Previous trends:** high skill and low skill were safe, mid skill has been cut by automation.
- **New Danger is regardless of level:** All logistics, transport, taxi, office support, security people, telemarketing, accounting, auditors, tech writers.
- **Industry Areas Most Effected:** Accommodation/Hospitality, Food Service, Manufacturing, Agriculture, Transportation, Warehousing, Retail, Mining, and Construction

Jobs at Risk of Automation

World Economic Forum is among the most negative: Five Million Jobs by 2020. The Real Challenge of the Fourth Industrial Revolution

- Skills and job displacement will affect every industry and geographical region, but losses can be offset by job growth in key areas.
- “Over the next five years is such that as many as 7.1 million jobs could be lost through redundancy, automation or disintermediation, with the greatest losses in white-collar office and administrative roles. This loss is predicted to be partially offset by the creation of 2.1 million new jobs, mainly in more specialized ‘job families’, such as Computer and Mathematical or Architecture and Engineering.”

47 % of U.S. jobs are at
risk of being replaced by
AI technologies and
computerization

Some recent comments

WaPo: Elon Musk, the billionaire inventor and Tesla chief executive — who believes artificial intelligence could help trigger the next world war — has issued another severe warning about how super-intelligent machines could come to dominate the world. Those super computers could become “an immortal dictator from which we would never escape,” Musk passionately warns in the new documentary “[Do You Trust This Computer?](https://doyoutrustthiscomputer.org/watch)”

Opinion

Andrew Yang: Yes, Robots Are Stealing Your Job

Self-driving trucks will be great for the G.D.P. They'll be terrible for millions of truck drivers.

Stop hyping artificial intelligence—patients will always need human doctors

COMMENT • 06 APRIL 2018

People must retain control of autonomous vehicles

Legislation on the testing of self-driving cars does not address liability and safety concerns, warn Ashley Nunes, Bryan Reimer and Joseph F. Coughlin.

From Siri to sexbots: Female AI reinforces a toxic desire for passive, agreeable and easily dominated women

From telephone operators to the ScarJo robot, tech's female voice has little to do with empowerment [UPDATED]

JENNIFER SEAMAN COOK
04.08.2016 • 7:00 PM

*This story has been **corrected** since it was originally published.*

A recent article titled “**Why is AI Female?**” made the connection that gendered labor, in service professions in particular, is fueling our expectations for gendered AI assistants and service robots. Furthermore, the author argues, this “feminizing — and sexualizing — of machines” signals a future with a disproportionate use of feminized VR and robots for a male-dominated sex industry. Monica Nickelsburg writes:

“Sex with robots is a big leap from asking Siri to set an alarm, but the fact that we’ve largely equated artificial intelligence with female personalities is worth examining. There are, after all, few sexualized male robots or avatars.”

Discussion Point 2: Is it wrong to create machines capable of making human labor obsolete? Contrast Kantian and act utilitarian perspectives.

THE ERRORS IN JOB REPLACEMENT LOGIC

- Every machine that replaces a job also creates new work.
- In many cases, we need AI to scale productivity to efficiently meet needs, like healthcare.
- Displaced jobs cause economic growth which creates new demands that are hard to predict.
- Historically, those places that automated increased their efficiency, and actually had very low unemployment rates

A MODIFIED ARGUMENT

- The First Industrial Revolution already replaced repetitive “manual” functions
- Now AI can replace all repetitive “cognitive” functions
- Compare with historic job destruction:
 - Average worker was replaced.
 - New job functions were to “design” the machine, and operate the “machine”
- Most places that automated had higher employment than before.
- Safest jobs*: (simplest argument)
 - Creating the AI machines
 - Operating and developing/designing the process for them to run.
 - Any managing function of people becomes managing of AI tools.

*Jobs least likely to be replaced by AI.

Economists and historians claim that job disruption actually helped the economies that participated.

One Caveat: The McKinsey Global Institute estimates that, compared with the Industrial Revolution of the late 18th and early 19th centuries, AI's disruption of society is happening ten times faster and at 300 times the scale.

Reference: Do we understand the impact of artificial intelligence on employment? | Bruegel

Textile vs Hand weaving: During the 19th century, amount of cloth a single weaver in America could produce = 50X gain. Labor required fell by 98%. Result: cloth became cheaper, demand greater, 4X more jobs were created in the same sector.

Auto vs Horse-based transportation: This led to a decline in horse-related jobs. However, the automobile industry itself grew fast. Jobs were also created in different sectors, e.g. motel and fast-food industries that arose to serve motorists and truck drivers.

ATM Machines at Banks: Automated teller machines (ATMs) reduce the number of bank clerks (20/bank in 1988 to 13/bank in 2004) by taking over some of their routine tasks. However, bank branches grew in numbers by 43% and total employees grew.

Only 9% of jobs are at risk
of being fully replaced.
Majority of jobs to be
amplified by AI.

But is job amplification with AI going to be easy? What problems might it raise?

Rise of Robot Radiologists

Deep-learning algorithms are peering into MRIs and x-rays with unmatched vision, but who is to blame when they make a mistake?

By Sara Reardon

tificial intelligence—for natural-language processing. But she had been looking for a new line of research and decided to team up with radiologists to develop machine-learning algorithms that use computers' superior visual analysis to spot subtle patterns in mammograms that the human eye might miss.

Over the next four years the team taught a computer program to analyze mammograms from about 32,000 women of different ages and races and told it which women had been diagnosed with cancer within five years of the scan. They then tested the computer's matching abilities in 3,800 more patients. Their resulting algorithm, published last May in *Radiology*, was significantly more accurate at predicting cancer—or the absence of cancer—than practices generally used in clinics. When Barzilay's team ran the program on her own mammograms from 2012—ones her doctor had cleared—the algorithm correctly predicted she was at a higher risk of developing breast cancer within five years than 98 percent of patients.

AI algorithms not only spot details too subtle for the human eye to see. They can also develop entirely new ways

“AI won't replace radiologists, but radiologists who use AI will replace radiologists who don't,” Curtis Langlotz, radiologist at Stanford
