## Notable Achievements in AI since 1995

- Computer-controlled minivan "drove" on freeways across USA in 1995
- IBM supercomputer Deep Blue defeated chess champion Gary Kasparov in 1997
- Honda's ASIMO android can climb and descend stairs and respond to human gestures and postures
- Electrolux introduced robotic vacuum cleaner in 2001
- Five autonomous vehicles successfully completed 128mile course in Nevada desert in 2005
- Watson trounced two most successful human Jeopardy! champions in 2011

## Chinese Hospitals Deploy AI to Help Diagnose Covid-19

Software that reads CT lung scans had been used primarily to detect cancer. Now it's retooled to look for signs of pneumonia caused by coronavirus.

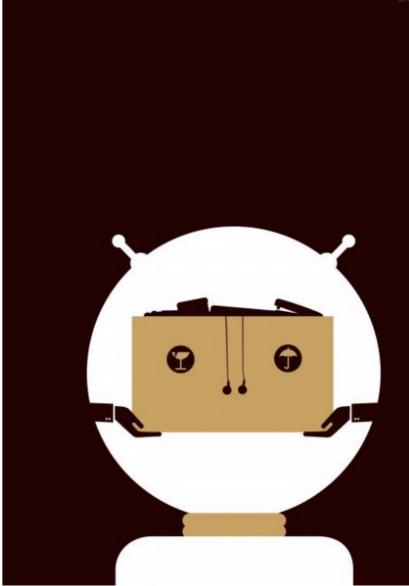

## Class Discussion 1

- How do we evaluate which AI based automations are worthwhile?
  - IBM Watson winning the Jeopardy Challenge
  - Google AI beating radiologists in cancer diagnosis
  - Al use in China to detect symptoms relating to COVID-19
- Discuss what societal benefits such technology can have. Does it pose any risks?

## How Technology Is Destroying Jobs

Automation is reducing the need for people in many jobs. Are we facing a future of stagnant income and worsening inequality?

by David Rotman June 12, 2013

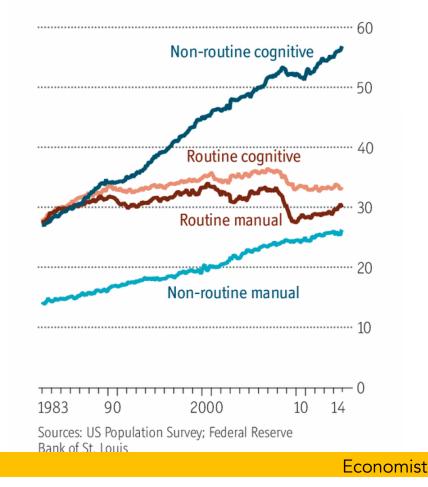

### AUTOMATION HAS BEEN CHANGING THE JOB LANDSCAPE FOR MANY YEARS

- Over many decades:
  - Routine jobs (manual or cognitive) have declined.
  - Only non-routine jobs have continued to grow. (Source: Economist)
- Now: The most famous study on Job Loss and AI, by Carl Frey and Michael Osbourne, predicts that 47% of the workforce is in danger.

#### Think

#### WHAT JOBS ARE IN DANGER

- **Previous trends**: high skill and low skill were safe, mid skill has been cut by automation.
- New Danger is regardless of level: All logistics, transport, taxi, office support, security people, telemarketing, accounting, auditors, tech writers.
- Industry Areas Most Effected: Accommodation/Hospitality, Food Service, Manufacturing, Agriculture, Transportation, Warehousing, Retail, Mining, and Construction

Sources: Frey, Osbourne, and US Dept. of Labor

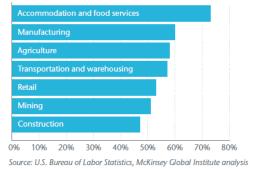

#### **Catalogue of fears**

#### Automation Potential by Industry

#### Jobs at Risk of Automation

### World Economic Forum is among the most negative: Five Million Jobs by 2020. The Real Challenge of the Fourth Industrial Revolution

- Skills and job displacement will affect every industry and geographical region, but losses can be offset by job growth in key areas.
- "Over the next five years is such that as many as 7.1 million jobs could be lost through redundancy, automation or disintermediation, with the greatest losses in white-collar office and administrative roles. This loss is predicted to be partially offset by the creation of 2.1 million new jobs, mainly in more specialized 'job families', such as Computer and Mathematical or Architecture and Engineering."

Cann, O. (2016, January 18). Five Million Jobs by 2020: the Real Challenge of the Fourth Industrial Revolution [Web log post]. Retrieved September 23, 2017, from <a href="https://www.weforum.org/press/2016/01/five-million-jobs-by-2020-the-real-challenge-of-the-fourth-industrial-revolution/">https://www.weforum.org/press/2016/01/five-million-jobs-by-2020-the-real-challenge-of-the-fourth-industrial-revolution/</a>

47 % of U.S. jobs are at risk of being replaced by AI technologies and computerization

## Some recent comments

WaPo: Elon Musk, the billionaire inventor and Tesla chief executive who believes artificial intelligence could help trigger the next world war — has issued another severe warning about how super-intelligent machines could come to dominate the world. Those super computers could become "an immortal dictator from which we would never escape," Musk passionately warns in the new documentary "Do You Trust This Computer?"

#### From Siri to sexbots: Female AI reinforces a toxic desire for passive, agreeable and easily dominated women

From telephone operators to the ScarJo robot, tech's female voice has little to do with empowerment [UPDATED]

This story has been corrected since it was originally published.

recent article titled "Why is AI Female?" made the connection that gendered labor, in service professions in particular, is fueling our expectations for gendered AI assistants and service robots. Furthermore, the author argues, this "feminizing – and sexualizing – of machines" signals a future with a disproportionate use of feminized VR and robots for a male-dominated sex industry. Monica Nickelsburg writes:

"Sex with robots is a big leap from asking Siri to set an alarm, but the fact that we've largely equated artificial intelligence with female personalities is worth examining. There are, after all, few sexualized male robots or avatars." Discussion Point 2: Is it wrong to create machines capable of making human labor obsolete? Contrast Kantian and act utilitarian perspectives.

### THE ERRORS IN JOB REPLACEMENT LOGIC

- Every machine that replaces a job also creates new work.
- In many cases, we need AI to scale productivity to efficiently meet needs, like healthcare.
- Displaced jobs cause economic growth which creates new demands that are hard to predict.
- Historically, those places that automated increased their efficiency, and actually had very low unemployment rates

#### A MODIFIED ARGUMENT

- The First Industrial Revolution already replaced repetitive "manual" functions
- Now AI can replace all repetitive "cognitive" functions
- Compare with historic job destruction:
- Average worker was replaced.
- New job functions were to "design" the machine, and operate the "machine"
- Most places that automated had higher employment than before.
- Safest jobs\*: (simplest argument)
- Creating the AI machines
- Operating and developing/designing the process for them to run.
- Any managing function of people becomes managing of Al tools.
  \*Jobs least likely to be replaced by Al.

Economists and historians claim that job disruption actually helped the economies that participated.

One Caveat: The McKinsey Global Institute estimates that, compared with the Industrial Revolution of the late 18th and early 19th centuries, Al's disruption of society is happening ten times faster and at 300 times the scale.

Reference: Do we understand the impact of artificial intelligence on employment? | Bruegel

Textile vs Hand weaving: During the 19th century, amount of cloth a single weaver in America could produce = 50X gain. Labor required fell by 98%. Result: cloth became cheaper, demand greater, 4X more jobs were created in the same sector.

Auto vs Horse-based transportation: This led to a decline in horse-related jobs. However, the automobile industry itself grew fast. Jobs were also created in different sectors, e.g. motel and fast-food industries that arose to serve motorists and truck drivers.

ATM Machines at Banks: Automated teller machines (ATMs) reduce the number of bank clerks (20/bank in 1988 to 13/bank in 2004) by taking over some of their routine tasks. However, bank branches grew in numbers by 43% and total employees grew. Only 9% of jobs are at risk of being fully replaced. Majority of jobs to be amplified by AI.

# But is job amplification with AI going to be easy? What problems might it raise?

# Rise of Robot Radiologists

Deep-learning algorithms are peering into MRIs and x-rays with unmatched vision, but who is to blame when they make a mistake?

By Sara Reardon

tificial intelligence—for natural-language processing. But she had been looking for a new line of research and decided to team up with radiologists to develop machine-learning algorithms that use computers' superior visual analysis to spot subtle patterns in mammograms that the human eye might miss.

Over the next four years the team taught a computer program to analyze mammograms from about 32,000 women of different ages and races and told it which women had been diagnosed with cancer within five years of the scan. They then tested the computer's matching abilities in 3,800 more patients. Their resulting algorithm, published last May in *Radiology*, was significantly more accurate at predicting cancer—or the absence of cancer—than practices generally used in clinics. When Barzilay's team ran the program on her own mammograms from 2012—ones her doctor had cleared—the algorithm correctly predicted she was at a higher risk of developing breast cancer within five years than 98 percent of patients.

AI algorithms not only spot details too subtle for the human eye to see. They can also develop entirely new ways

"AI won't replace radiologists, but radiologists who use AI will replace radiologists who don't," Curtis Langlotz, radiologist at Stanford

## Treading with caution

Attention to noise, bias, and "provenance" — broadly, where did data arise, what inferences were drawn from the data, and how relevant are those inferences to the present situation?

## CRITICAL QUESTIONS FOR BIG DATA Provocations for a cultural, technological, and scholarly phenomenon

The era of Big Data has begun. Computer scientists, physicists, economists, mathematicians, political scientists, bio-informaticists, sociologists, and other scholars are clamoring for access to the massive quantities of information produced by and about people, things, and their interactions. Diverse groups argue about the potential benefits and costs of analyzing genetic sequences, social media interactions, health records, phone logs, government records, and other digital traces left by people. Significant questions emerge. Will large-scale search data help us create better tools, services, and public goods? Or will it usher in a new wave of privacy incursions and invasive marketing? Will data analytics help us understand online communities and political movements? Or will it be used to track protesters and suppress speech? Will it transform how we study human communi-
